Trackify:
Stay On Track, Stay Engaged!

Presented on: 23/11/2024, before the jury of commission

Acknowledgement

The completion of this project, *Trackify*, marks a significant milestone in our academic journey, and we are profoundly grateful to everyone who contributed to its success. This accomplishment is the result of collective efforts, dedication, and unwavering support from mentors, colleagues, friends, and family.

First, we would like to extend our deepest gratitude to our professors and mentors at *ENET'COM*. Their expertise, constructive feedback, and continuous encouragement guided us through the complexities of this project. Their commitment to fostering innovation and critical thinking inspired us to approach challenges creatively and with determination. Their mentorship has been invaluable, and we are truly fortunate to have learned under their guidance.

We also owe a debt of gratitude to the administration of *ENET'COM* for providing access to state-of-the-art resources and facilities, which were essential for the successful implementation of *Trackify*. The supportive environment created by the institution allowed us to focus on our goals and push the boundaries of what we could achieve. We are equally thankful to the technical staff for their assistance with equipment and logistics during the development and testing phases.

Finally, we extend our heartfelt thanks to our families and friends for their unwavering support, patience, and understanding throughout this journey. Their encouragement during challenging times and their belief in our abilities kept us motivated. This accomplishment would not have been possible without their love and support. To all who contributed to this journey, we are sincerely grateful.

GENERAL INTRODUCTION

The Digilog Project: **Process Optimization Challenge**, led by FABLAB "**SLLID 4.0**," is an innovative platform designed to push the boundaries of technology in educational systems. The challenge invites participants to develop the Time and Study Attendance System (TSAS), a solution aimed at automating and enhancing attendance tracking and engagement analysis in schools, institutes, and universities. With a focus on addressing the inefficiencies of traditional attendance methods, TSAS seeks to simplify processes, reduce errors, and provide meaningful insights for educators and administrators. By leveraging modern technologies, this challenge creates a pathway for participants to showcase their creativity and problem-solving skills.

Central to the challenge is the need for an intelligent system capable of tackling real-world educational issues. TSAS aims to integrate advanced features such as automated attendance tracking through facial recognition or RFID technology, ensuring precise and seamless monitoring. Beyond attendance, the system is designed to analyze trends in student engagement and punctuality, offering educators valuable tools to identify areas for improvement and provide targeted support. The challenge also emphasizes energy efficiency, encouraging optimization of resources like cameras and sensors to align with sustainable practices while maintaining high system performance.

Equally important is the focus on ethical and secure design. Participants are required to develop solutions that respect privacy regulations, such as GDPR, ensuring the protection of student data and personal information. This emphasis on privacy, combined with the need for innovative functionality, underscores the comprehensive nature of the challenge. By participating, students and professionals alike gain hands-on experience in creating impactful, scalable solutions, redefining how educational institutions manage attendance, engagement, and operational efficiency in a rapidly evolving digital world.

State of the art

Contents

1.1 INTRODUCTION

This chapter introduces the context and challenges addressed by the Time and Study Attendance System (TSAS). Educational institutions face increasing demands to improve operational efficiency while fostering an engaging learning environment. Among these demands, attendance tracking and student engagement monitoring remain essential but challenging tasks. Traditional methods, such as manual roll calls or paper-based systems, are not only time-consuming but also prone to errors and manipulation. In this chapter, we explore the problematic, analyze existing approaches, propose a comprehensive solution, and outline the conception phase, which lays the foundation for designing an innovative system tailored to modern educational needs.

1.2 Presentation of SLIID4.0 FabLab

The Sfax Living Lab on Industry 4.0 (SLLID4.0), established within the École Nationale d'Électronique et des Télécommunications de Sfax (ENET'Com), serves as a dynamic platform for innovation, research, and practical learning in the realm of Industry 4.0 technologies. This initiative aligns with ENET'Com's strategic vision to integrate advanced technological education with real-world applications, fostering a collaborative environment for students, researchers, and industry professionals.

1.3 Problem Statement

Managing attendance and engagement is a cornerstone of academic success, yet educational institutions face persistent challenges in implementing effective systems.

   - **Importance of Attendance and Engagement Management**: Accurate tracking of attendance and engagement is critical for educational success.

   - **Reliance on Manual Processes**: Current methods, such as roll calls or sign-in sheets, are time-consuming and inefficient.

- **Disruption of Classroom Activities**: Manual attendance tracking interrupts teaching and learning.

- **Lack of Real-Time Data**: Existing methods fail to provide immediate, actionable insights.

- **No Analysis of Key Metrics**: Important indicators like punctuality and student engagement are often overlooked.

- **Challenges in Identifying At-Risk Students**: Traditional systems do not support timely identification and intervention for students in need of support.

- **Insufficient Technological Infrastructure**: Many institutions are unable to automate processes securely and efficiently.

- **Privacy and Security Concern**s: Existing methods do not adequately adhere to data protection regulations.

- **Need for a Better Solution**: These limitations call for a smarter, scalable, and reliable system to address the challenges effectively.

Addressing these challenges requires a modernized, technology-driven approach that not only automates attendance tracking but also enhances engagement monitoring and adheres to privacy regulations.

1.4 Existing Case

Currently, most educational institutions rely on traditional methods of attendance tracking. These include manual roll calls, sign-in sheets, or basic digital systems requiring manual input. While functional, these methods present significant drawbacks:

- **Inefficiency**: Manual processes are time-intensive, reducing instructional time and increasing administrative workloads.

- **Error-Prone**: Human error in record-keeping can lead to inaccuracies, including misrecorded or lost attendance data.

- **Lack of Analytics**: Existing systems rarely provide insights into student behavior, punctuality, or engagement.

- **Security Risks**: Basic systems are vulnerable to manipulation, such as proxy attendance.

- **Limited Scalability**: Current approaches are challenging to implement effectively in large institutions with numerous students and classes.

These issues underscore the inadequacy of existing systems and the pressing need for a modernized approach.
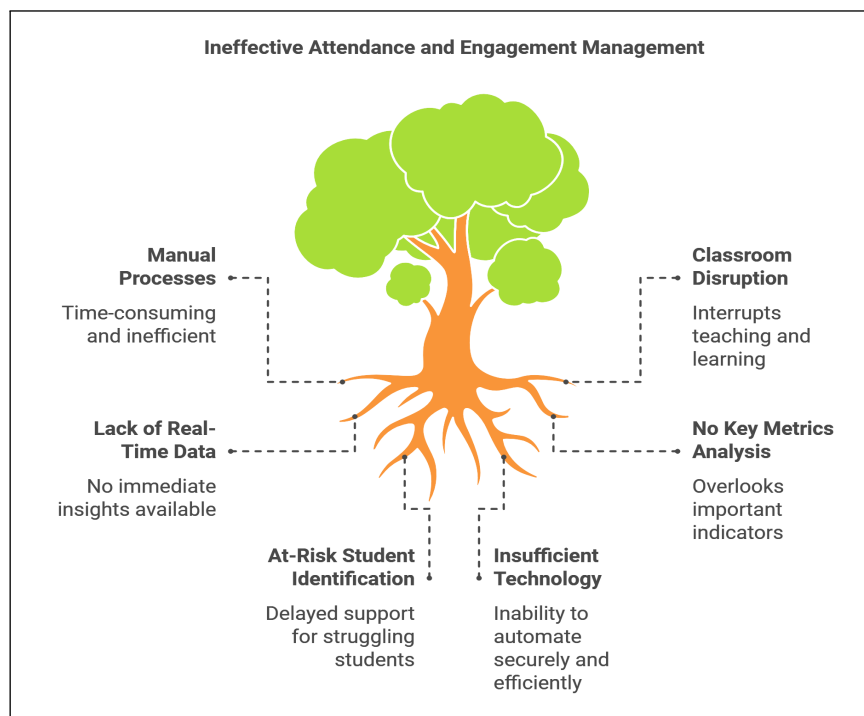

Figure 1.1: Challenges of Ineffective Attendance and Engagement Management in Education

1.5 Proposed Solution

The "**Trackify**" offers a modern, scalable, and secure solution to optimize attendance tracking and engagement monitoring in educational institutions. Below is a comprehensive overview of TSAS's core features and benefits:

- **Integrated Attendance Tracking**: Utilizes RFID technology and facial recognition for secure and accurate student identification, automating the attendance process while preventing proxy attendance.

- **Real-Time Engagement Monitoring**: Tracks punctuality and classroom engagement, providing actionable insights to students, professors, and administrators through user-friendly dashboards.

- **Streamlined Communication**: Sends timely WhatsApp reminders 5 minutes before class, ensuring students are prepared and punctual while leveraging the school's Wi-Fi for efficient communication.

- **User-Specific Dashboards**: Offers tailored interfaces:

* **Students**: Monitor attendance, engagement, and punctuality.

* **Professors**: Access detailed class data and manage attendance.

* **Administrators**: View behavior trends and generate reports.

- **Administrative Oversight**: Tracks absences, engagement trends, and notifies stakeholders in critical situations, enabling proactive interventions.

- **Energy Efficiency and Scalability**: Optimizes resource usage, reducing costs while supporting integration into institutions of varying sizes.

- **Commitment to Privacy and Security**: Protects student data through encryption and ensures compliance with regulations like GDPR.

- **Future-Ready Design**: Plans to evolve into a mobile app for seamless access and push notifications on smartphones.

The TSAS combines innovative technology with practical functionality to improve classroom management, promote student success, and streamline administrative operations.
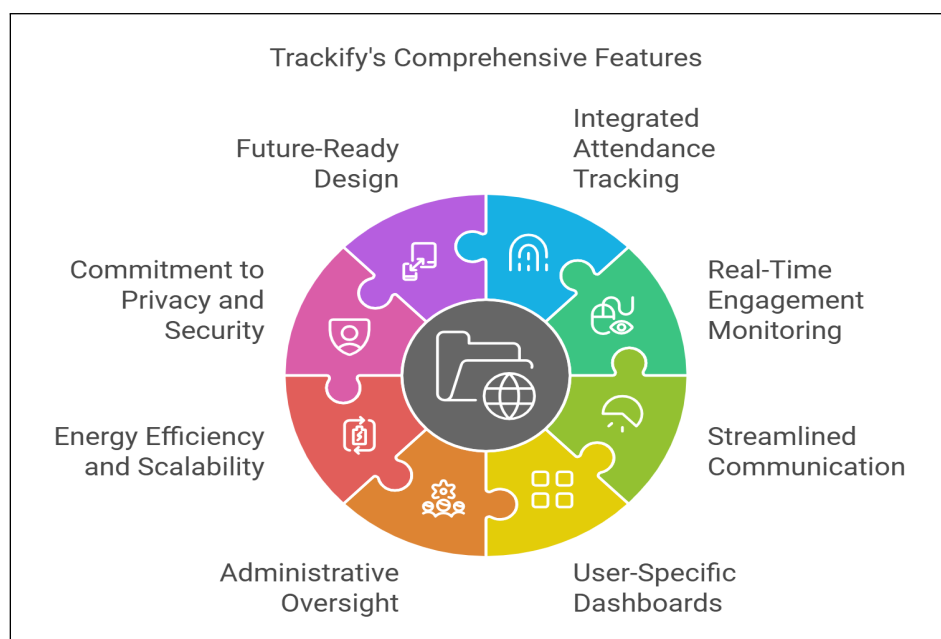

Figure 1.2: Key Features of Trackify

1.6 Conception

1.6.1 Functional Specification

1.6.1.1 Requirement Specification

The requirement specification forms the cornerstone of the development process for the **Time and Study Attendance System (TSAS)**. It serves as the starting point for identifying and formalizing the needs of the application. This phase involves a comprehensive analysis of the problem space and stakeholder expectations, laying the groundwork for a system that addresses all functional and non-functional requirements.

The main objective of the requirement specification phase is to ensure the application meets user needs while operating efficiently, securely, and reliably. The focus is on capturing the functional requirements, which define the system's core operations, and the non-functional requirements, which specify the performance, usability, and scalability constraints. This dual emphasis ensures the development of a robust and user-centered platform that aligns with the demands of students, professors, and administrators.

1.6.1.2 Functional Requirements

The functional requirements define the operational capabilities of the TSAS, ensuring it performs the intended tasks effectively. These include:

- **Authentication and Attendance Recording:** Use RFID and facial recognition for accurate and secure attendance tracking, preventing proxy attendance through dual verification methods.

- **Dashboard and Analytics:** Provide dashboards for students, professors, and administrators, enabling real-time monitoring of attendance and engagement. Allow professors to access class trends and student-specific data.

- **Automated Notifications:** Send timely reminders to students (e.g., pre-class alerts) and notifications to professors or administrators in critical situations.

- **Engagement Monitoring:** Track and analyze student engagement during classes using participation data and attendance logs.

- **Reporting and Insights:** Generate detailed reports for administrative decision-making and trend analysis.

1.6.1.3 Non-Functional Requirements

Non-functional requirements establish the operational constraints of the TSAS to ensure optimal performance and usability. These include:

- **Ergonomics:** The application interfaces must be simple, clear, and intuitive for all users.

- **Availability:** The system should be accessible at all times, ensuring uninterrupted service for users.

- **Security:** Robust authentication mechanisms should safeguard sensitive data, limiting access to authorized users only.

- **User-Friendliness:** The platform should be easy to use, minimizing the learning curve for all stakeholders.

- **Scalability:** The system must accommodate future enhancements and the addition of new features to meet evolving user needs.

1.6.2 Needs Analysis

The analysis phase is critical for understanding user requirements and expectations. It involves gathering insights through methods such as interviews, surveys, and observations to identify the specific functionalities and workflows users need. This phase aims to:

- **Define Goals and Motivations:** Understand what users aim to achieve with the Trackify- and why these goals are important.

- **Map User Workflows:** Outline how users interact with the system to ensure it supports their daily tasks seamlessly.

- **Design Intuitive Interfaces:** Create interfaces that are user-friendly, ensuring the system is easy to navigate and operate.

The needs analysis provides the foundation for designing a system that aligns with user expectations and ensures a smooth, intuitive experience.

1.6.2.1 Modeling Language Selection

To effectively represent and communicate the system's structure, behavior, and interactions, **Unified Modeling Language (UML)** has been selected as the modeling framework. UML provides standardized, visual diagrams that capture the various aspects of the software system, including:

- **Use Case Diagrams:** Highlight user interactions with the system.

- **Class Diagrams:** Define the system's structural components and their relationships.

- **Sequence Diagrams:** Illustrate the dynamic flow of operations between system components.

The adoption of UML ensures clarity, consistency, and effective communication throughout the development process, allowing stakeholders to gain a comprehensive understanding of the system's architecture and functionality.

1.6.2.2 Global Use Case Diagram

Figure 1.3 presents the Global Use Case Diagram of the Time and Study Attendance System (TSAS), highlighting the interactions between the three main actors: Student, Professor, and Administration. The diagram provides a detailed view of their roles and respective actions within the system. The student primarily interacts with the system for attendance authentication using RFID or facial recognition and for consulting personal metrics such as attendance and engagement. The professor, on the other hand, manages classroom operations, including unlocking the classroom, controlling the electricity system, triggering facial recognition for students without RFID, and monitoring student engagement during sessions.

The administration oversees more comprehensive system functions, such as managing class schedules, sending reminders, modifying the database, and monitoring the entire system to

ensure its smooth operation. Relationships like «include» and «extend» illustrate the dependencies and optional functionalities within the system. For example, facial recognition is an extended process triggered only when RFID authentication fails, while actions like updating attendance records are included as integral parts of the system's workflow. This modular design demonstrates TSAS's flexibility in addressing varied authentication scenarios and ensuring a seamless experience for all users.
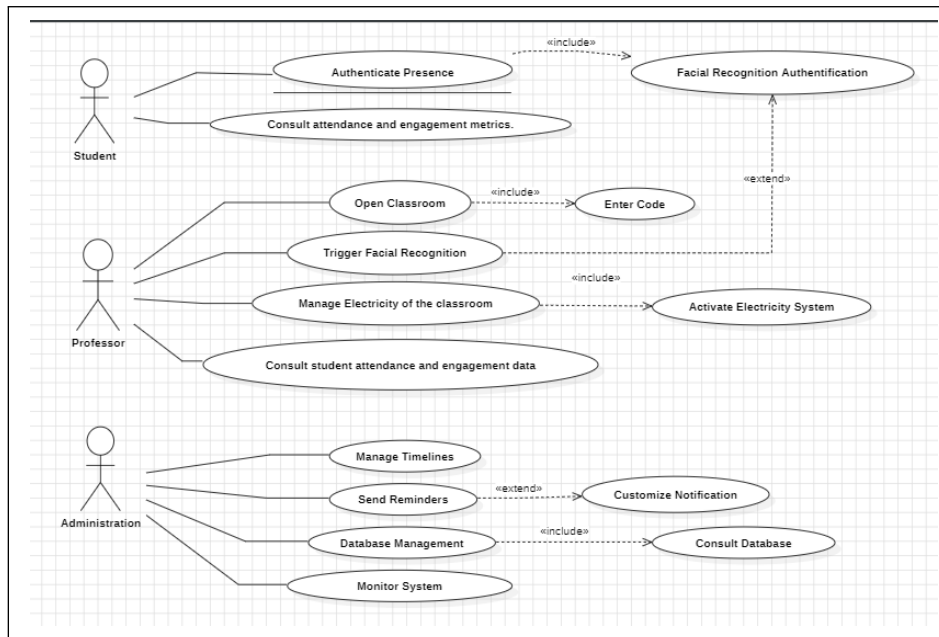

Figure 1.3: the high-level functionality of the TSAS system

1.6.2.3 Refined Use Case Diagram

Figure 1.4 presents the refined use case diagram for the "Authenticate Presence" process in the TSAS. This diagram delineates the interactions between the student, professor, and system during attendance authentication.

The primary use case, "Authenticate Presence," involves the student confirming their attendance using their RFID-enabled ID card. This standard procedure is depicted through the "RFID Authentication" included use case. In situations where the student forgets their RFID card, the professor assists by initiating the "Trigger Facial Recognition" extended use case, which leads to the "Facial Recognition Authentication" included use case. This ensures that the student's attendance can still be recorded accurately.

Upon successful authentication—whether via RFID or facial recognition—the system proceeds to "Update Attendance Record," ensuring that attendance data is up-to-date. The use of include and extend relationships in the diagram highlights the modularity and flexibility of the system in handling different authentication scenarios.
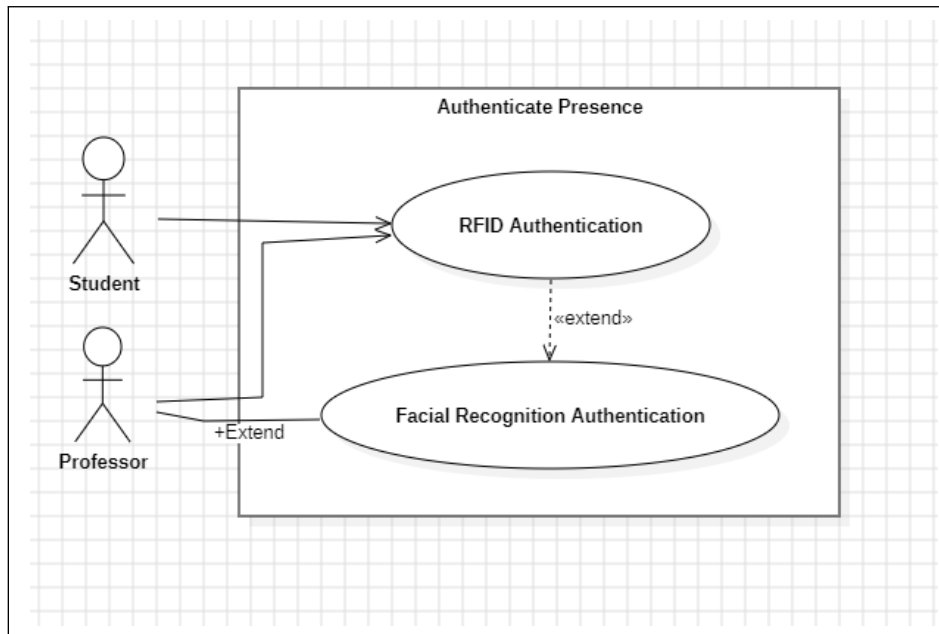

Figure 1.4: The authenticate presence process

1.6.2.4   Textual Descriptions of Use Case

The table 1.1 above describes the Update Attendance Record use case in the TSAS. This automated process ensures a student's attendance is accurately recorded after successful authentication via RFID or facial recognition. The system logs the authentication method, updates the record with the date and time, saves it in the database, and notifies the professor and student of the successful update.

This use case is essential for maintaining accurate attendance data and ensuring transparency. By automating the process, TSAS eliminates errors associated with manual tracking and ensures data integrity. There are no alternative scenarios, as the process is directly triggered by successful authentication.

Use Case	Update Attendance Record
Actors	System
Preconditions	- The student has been authenticated successfully via RFID or facial recognition.
Postconditions	- The student's attendance record is updated in the database. - The date, time, and authentication method are logged.
Principal Scenarios	1. The system logs the authentication method used. 2. The system updates the attendance record with the current date and time. 3. The record is saved in the database. 4. The system notifies the professor and student of the successful update.
Alternative Scenarios	None.

<center>**Table 1.1: Update Attendance Record Use Case**</center>

1.6.2.5   Class Diagram

The Figure 1.5 represents the architecture of the Trackify System, highlighting its core entities, attributes, methods, and relationships. The central User class is inherited by Student, Professor, and Administrator, each extending the base functionality with role-specific attributes and methods. For example, the Student class tracks attendance and engagement metrics through "trackAttendance()" and "trackEngagement()" methods, while the Professor manages classrooms with methods like "monitorEngagement()" and "controlResource()". The Administrator oversees system operations using functions such as "manageDatabase()", "organizeSchedules()", and "systemMonitoring()".

Supporting classes like Attendance and Engagement record session data with methods such as "recordAttendance()" and "recordParticipation()". The Authentication class, assisted by FacialRecognition, verifies user identities through verifyIdentity() and "processFacialRecognition()". Notifications are handled by the Notification class with "sendNotification()" and "scheduleReminder()". The Classroom class manages resources, including the ElectricitySystem and RFIDReader, with methods like "manageRFIDReaders()" and "controlElectricity()". Together, these classes demonstrate a modular, scalable system design for attendance tracking and resource management.
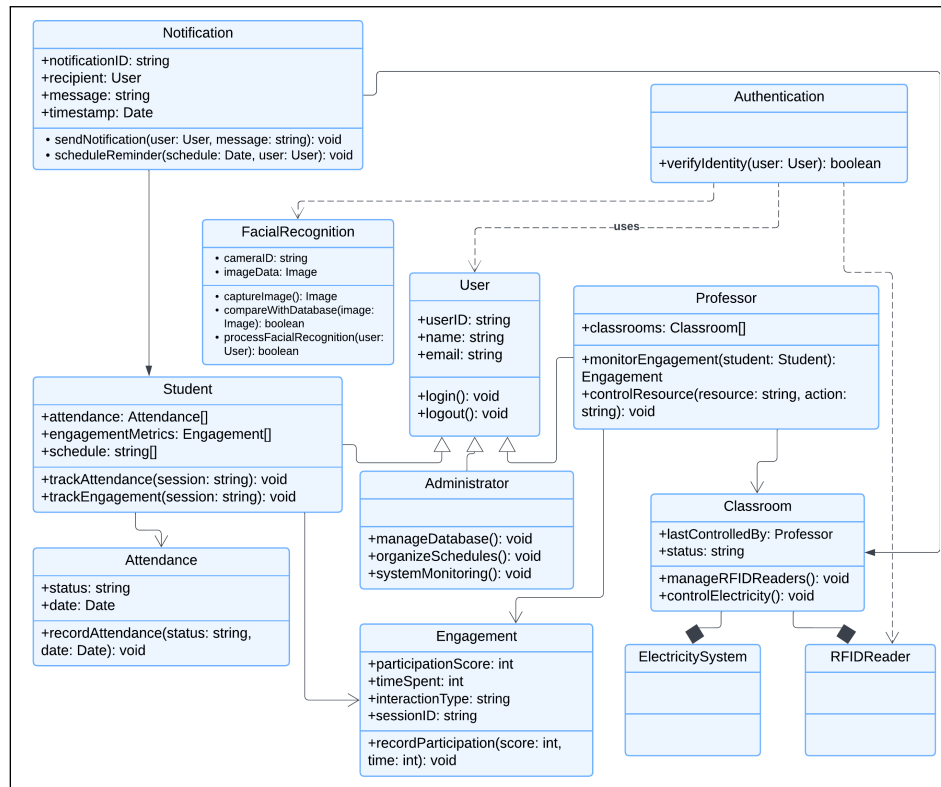

Figure 1.5: Class Diagram for the Trackify System

1.6.2.6   Sequence Diagram

The figure 1.6 illustrates the dynamic interactions within the Trackify System, showcasing how key actors—Student, Professor, and Administrator—engage with system components like Authentication, Attendance, Classroom, Engagement, and Notification. The process begins with the student authenticating attendance through RFID or, if unavailable, via facial recognition triggered by the professor. The Authentication component verifies the student's identity, and the Attendance system logs the record with a timestamp.

Professors manage classroom resources by unlocking classrooms and controlling electricity through the Classroom system. During sessions, they monitor student engagement using metrics provided by the Engagement system. Administrators oversee operations by scheduling notifications, generating attendance and engagement reports, and managing the database. Notifications are sent to users as reminders or alerts via the Notification system, ensuring effective communication and system-wide coordination.

Figure 1.6: Sequence Diagram of the Trackify System

1.7 CONCLUSION

We thoroughly examined the architecture and functionality of the Trackify System, focusing on its core components, interactions, and processes. Through detailed diagrams, including the class and sequence diagrams, we highlighted how the system integrates key elements like Authentication, Attendance, Engagement, Classroom, and Notification to ensure efficient management of attendance tracking, classroom operations, and student engagement.

The sequence diagram provided insights into the dynamic flow of interactions between actors (Student, Professor, and Administrator) and the system's components, showcasing the robustness and flexibility of the system. By employing modular design principles and advanced technologies such as RFID and facial recognition, Trackify offers a reliable, scalable, and user-friendly solution. This chapter serves as a foundational understanding of the system's design, paving the way for implementation and further optimization in the subsequent sections.

Chapter

2

Hardware Implementation

Contents

2.1 Introduction

In this chapter, we present the various tools and components used in the development of the *Trackify* system. This project involves the integration of hardware and software tools to create an automated attendance and engagement monitoring system. Each section details a specific component, highlighting its role in the system, its technical features, and the rationale behind its selection. By carefully implementing these tools, *Trackify* achieves reliability, accuracy, and scalability.

2.2 Hardware Environment

The hardware environment forms the backbone of the *Trackify* system, consisting of essential components that perform core operations. Each component was selected to meet the system's requirements and ensure optimal performance.

2.2.1 Description of the Raspberry Pi 4

The *Raspberry Pi 4* is a versatile single-board computer that serves as the brain of the system. Its powerful processing capabilities and extensive connectivity options make it an ideal choice for this project.

- **Key Features:**

  - ARM Cortex-A72 quad-core processor running at 1.5 GHz.

  - Up to 4GB of RAM for multitasking.

  - USB 3.0 and Ethernet ports for fast communication and external device support.

  - GPIO (General Purpose Input/Output) pins for interfacing with hardware components.

- **Role in the Project:**

  - Processes data from sensors such as the RFID reader, camera, and ultrasonic sensor.

  - Hosts Python scripts for facial recognition, attendance management, and engagement monitoring.

– Manages the WhatsApp chatbot for real-time communication with users.
Figure 2.1: Raspberry Pi 4: The core processing unit of the system.

2.2.2 Breadboard

The *breadboard* is a temporary platform used for assembling and testing electronic circuits without soldering. It is invaluable during the prototyping phase.

- **Features:**

  - Compatible with components such as resistors, sensors, LEDs, and microcontrollers.

  - Facilitates easy connection and testing of circuits.

- **Role in the Project:**

  - Provides a flexible environment for testing components like the RFID reader and ultrasonic sensor.

  - Ensures all connections are optimized before permanent assembly.

2.2.3 Hikvision 1080p Camera

The *Hikvision 1080p Camera* is an advanced imaging device that plays a crucial role in the facial recognition system.

- **Key Features:**

  - Full HD resolution (1920x1080 pixels) for capturing detailed images.

– Night vision capabilities for low-light environments.

– Advanced image processing features for enhanced clarity.

- **Role in the Project:**

  – Captures images for facial recognition, ensuring secure attendance logging.

  – Integrates with OpenCV for real-time image analysis and matching.

Figure 2.2: Hikvision 1080p Camera: Facilitates facial recognition for authentication.

2.2.4   Ultrasonic Sensor

The *ultrasonic sensor* measures distances and detects presence using ultrasonic waves.

- **Key Features:**

  – Measuring range: 2 cm to 400 cm.

  – High accuracy through time-of-flight evaluation of ultrasonic waves.

- **Role in the Project:**

  – Detects occupancy in classrooms to optimize resource usage (e.g., turning off lights).

  – Provides additional data for monitoring activity levels.
Figure 2.3: Ultrasonic Sensor: Detects presence and monitors activity levels.

2.2.5   RFID Reader

The *RFID reader* is a device that authenticates students by scanning RFID-enabled ID cards.

- **Key Features:**

  - Operating frequency: 13.56 MHz.

  - Compatible with ISO/IEC 14443-compliant RFID cards.

- **Role in the Project:**

  - Authenticates students and logs their attendance securely.

  - Acts as the primary input for attendance tracking.

Figure 2.4: RFID Reader: Enables quick and reliable attendance logging.

2.2.6   Dual-Relay Card

The dual-relay card is an essential hardware component used in the Trackify system to manage the electrical operations of the classrooms. It allows for automated control of electrical circuits, ensuring energy efficiency and operational convenience.

Features:

- **Dual Relays:** Supports the control of two independent electrical circuits.

- **High Voltage Tolerance:** Handles up to 250V AC and 30V DC, making it suitable for classroom electrical systems.

- **Microcontroller Compatibility:** Easily integrates with the Raspberry Pi for seamless automation.

- **Indicator LEDs:** Displays the operational status of each relay for real-time monitoring.

Role in the Project:

- Activates the classroom's electrical systems (lighting, power outlets) when the professor checks in using the RFID tag.

- Deactivates electrical systems when the professor checks out, conserving energy.

- Ensures a reliable and automated workflow for managing classroom utilities.

Figure 2.5: Dual-Relay Card

2.3 Software Environment

The software environment plays a critical role in enabling the functionality of the *Trackify* system. It bridges the hardware components and provides the intelligence required for real-time processing, data analysis, and user interaction. In this section, we detail the software tools and frameworks used to develop the system, emphasizing their functionalities, features, and how they contribute to achieving the project's objectives.

2.3.1 Python

Python serves as the backbone of the *Trackify* system, providing a robust platform for scripting and development. Its simplicity, versatility, and extensive library support make it ideal for implementing complex algorithms and hardware-software integration.

- **Features:**

  - Extensive libraries such as `pyserial` for hardware communication, `sqlite3` for database management, and `OpenCV` for image processing.

  - Cross-platform compatibility, enabling seamless deployment on the Raspberry Pi 4.

  - Readability and modularity, facilitating rapid prototyping and easy debugging.

- **Role in the Project:**

  - Manages hardware interactions, including data collection from the RFID reader, ultrasonic sensor, and Hikvision camera.

  - Implements real-time algorithms for facial recognition and attendance tracking.

  - Integrates with the WhatsApp API to handle communication workflows, such as sending notifications and reminders.

  - Automates resource management by monitoring classroom occupancy and controlling electrical devices.

Python's extensive capabilities ensure that *Trackify* operates efficiently, leveraging state-of-the-art libraries to handle computationally intensive tasks with ease.

2.3.2   OpenCV

The OpenCV (Open Source Computer Vision) library is a powerful tool for image and video processing, playing a pivotal role in the system's facial recognition functionality.

- **Features:**

  - Pre-built functions for face detection, feature extraction, and recognition.

  - Real-time image processing capabilities, critical for maintaining accuracy and speed.

  - Support for multiple algorithms, including Haar cascades and deep learning-based approaches.

- **Role in the Project:**

  - Processes images captured by the Hikvision 1080p camera, identifying and verifying student faces.

  - Ensures secure authentication by matching facial features with a preloaded database.

  - Provides feedback to the system on successful or failed recognition attempts.

By integrating OpenCV, *Trackify* achieves an additional layer of security, ensuring that attendance data is accurate and resistant to manipulation.

Figure 2.6: OpenCV

2.3.3   SQLite Database

SQLite is a lightweight, serverless database engine used to store and manage data for the *Trackify* system. Its efficiency and simplicity make it well-suited for embedded systems like the Raspberry Pi 4.

- **Features:**

    - Relational database management with support for SQL queries.

    - Lightweight architecture with minimal setup and maintenance requirements.

    - High reliability and support for transactional operations.

- **Role in the Project:**

    - Stores critical data, including student attendance records, engagement metrics, and system logs.

    - Provides a centralized location for retrieving and updating information in real time.

    - Ensures data integrity and consistency through robust query handling and transaction support.

The SQLite database underpins the *Trackify* system's data-driven operations, enabling smooth access and management of large volumes of information.

2.3.4   WhatsApp API

The WhatsApp API provides a communication interface for the *Trackify* system, facilitating real-time interactions between the system and its users.

- **Features:**

    - Supports text and multimedia messaging with robust delivery mechanisms.

    - Integrates seamlessly with Python using libraries like `Twilio` or `yowsup`.

    - Provides end-to-end encryption, ensuring secure communication.

- **Role in the Project:**

  – Sends automatic reminders to students about upcoming classes, including room numbers and schedules.

  – Notifies professors of student attendance and engagement metrics in real time.

  – Enhances user interaction by offering a familiar and accessible communication platform.

The WhatsApp API ensures that the system remains interactive and user-friendly, bridging the gap between technology and its users.

Figure 2.7: WhatsApp API

2.3.5 Custom Algorithms

The *Trackify* system incorporates custom Python algorithms to manage the integration of hardware and software components effectively.

- **Features:**

  – Dynamic handling of data streams from multiple sources (RFID, sensors, and camera).

  – Error detection and recovery mechanisms to ensure system reliability.

  – Optimization routines for resource management, reducing energy consumption.

- **Role in the Project:**

  – Implements a two-factor authentication process combining RFID and facial recognition.

  – Monitors classroom activity and controls electrical devices based on occupancy.

  – Generates engagement reports for administrators and professors.

These custom algorithms represent the core intelligence of the *Trackify* system, enabling it to adapt to different scenarios and perform complex tasks with minimal user intervention.

2.4 Conclusion

The development of *Trackify* relied on a seamless integration of advanced hardware and software tools, each carefully selected for its technical capabilities and alignment with the system's objectives. The hardware environment, comprising components such as the Raspberry Pi 4, RFID reader, ultrasonic sensor, and Hikvision camera, provided the foundation for reliable data collection and efficient resource management. Meanwhile, the software environment, featuring Python, OpenCV, SQLite, and the WhatsApp API, ensured real-time data processing, secure communication, and intelligent decision-making.

Together, these components form a robust and scalable system, capable of addressing the challenges of attendance and engagement monitoring in educational institutions. The inclusion of custom algorithms further enhances *Trackify*'s adaptability and effectiveness, optimizing its performance across diverse scenarios. This comprehensive integration not only elevates the system's functionality but also sets a strong foundation for future enhancements and broader implementation.

Chapter

3

Realisation

Contents

3.1 Introduction

This chapter outlines the implementation of the Trackify system, detailing the integration of hardware, software, and workflows. The focus is on achieving seamless functionality to address the needs of students, professors, and administrators.

By leveraging technologies like RFID, facial recognition, and WhatsApp chatbots, Trackify automates attendance management and classroom operations. The chapter highlights key user scenarios, system architecture, and the steps taken to deploy the solution effectively in an academic environment.

3.2 Implementation Scenarios of the Trackify System

In the development of the Trackify system, several user scenarios have been meticulously designed to address the specific needs and challenges faced by students, professors, and the administration. These scenarios illustrate the system's functionality and its response to various situations, ensuring a seamless and efficient experience for all users.

3.2.1 Professor Check-In and Classroom Activation

Scenario: A professor arrives at the classroom to commence a lecture.

Process:

- The professor uses an RFID tag to check in at the classroom entrance.

- Upon successful authentication, the system records the check-in time.

- Simultaneously, the classroom's electrical systems are activated, and management sensors, such as ultrasonic sensors, are deactivated to prevent unnecessary monitoring during the lecture.

- Students are then permitted to check in their attendance.

Outcome: The classroom is prepared for the lecture, with all necessary systems activated and attendance tracking enabled.

3.2.2 Student Check-In with RFID and Facial Recognition

Scenario: Students arrive for the lecture and need to register their attendance.

Process:

- Students present their RFID tags at the entrance to check in.

- The system records each student's entry time.

- If a student forgets their RFID tag, the professor can authorize the use of facial recognition.

- The professor activates the camera equipped with an OpenCV-based facial recognition model.

- The student scans their face, and upon successful recognition, their attendance is recorded.

Outcome: All students' attendance is accurately recorded, accommodating those without their RFID tags through an alternative verification method.

3.2.3 Pre-Class Notifications via WhatsApp Chatbot

Scenario: Students receive reminders about upcoming classes.

Process:

- Prior to the class, a WhatsApp chatbot sends notifications to students.

- The message includes details such as the class schedule, subject, classroom number, and professor's name.

Outcome: Students are reminded of their upcoming classes, promoting punctuality and engagement.

3.2.4 Administrative Oversight and System Management

Scenario: The administration oversees the entire system's operations.

Process:

- Administrators have access to the central database, allowing them to monitor and modify system settings.

- They can oversee sensor statuses, engagement metrics, and student attendance records.

- Remote management capabilities enable administrators to control various aspects of the school's systems, including individual classrooms.

Outcome: The administration maintains comprehensive control over the system, ensuring optimal performance and addressing any issues promptly.

3.2.5   Professor Check-Out and Classroom Deactivation

Scenario: The lecture concludes, and the professor prepares to leave the classroom.

   Process:

- The professor checks out by scanning their RFID tag again.

- The system records the check-out time.

- The classroom's electrical systems are deactivated to conserve energy.

- Management sensors, such as ultrasonic sensors, are reactivated to monitor the classroom post-lecture.

Outcome: The classroom is secured and monitored after use, with energy consumption minimized.

=> These scenarios demonstrate Trackify's comprehensive approach to attendance management and classroom control, ensuring efficiency, security, and user engagement across all levels of the institution.

3.3 The Model Implementation

The facial recognition model is a critical component of Trackify, enabling alternative attendance registration for students without their RFID tags. This section details the camera setup, system functionality, testing phases, and resulting accuracy.

3.3.1 Camera Setup and Cabling

The system utilizes a high-resolution Hikvision 1080p camera for facial recognition. The camera is strategically positioned at classroom entrances for optimal coverage.

- **Connection:** The camera is connected to the Raspberry Pi via USB or Ethernet, ensuring fast data transfer.

- **Power Supply:** A reliable power source is provided to maintain uninterrupted operation.

3.3.2 Functional System

The camera captures images of students during check-in. These images are processed by an OpenCV-based facial recognition model trained on authorized user data.

- **Workflow:** The system detects faces, extracts features, and matches them against the database.

- **Real-Time Authentication:** Upon successful recognition, the system logs the attendance.

3.3.3 AI Model Specifications and Integration

The facial recognition component of the Trackify system is powered by an AI model that ensures accurate and efficient authentication for students. This section outlines the model's technical specifications, training process, and integration with the system's hardware and software components.

3.3.3.1 Overview of the AI Model

The AI model used in Trackify is based on a convolutional neural network (CNN) optimized for facial recognition tasks. The model is lightweight yet robust, designed to work efficiently with limited resources like the Raspberry Pi 4 while maintaining high accuracy in diverse environments.

- **Model Architecture:** The AI model utilizes a pre-trained ResNet-50 backbone for feature extraction, followed by a fully connected layer for classification and identification tasks.

- **Framework:** The model is developed using TensorFlow and OpenCV for integration with the camera hardware.

- **Dataset:** Training was performed on a publicly available dataset, augmented with additional facial images collected in a controlled environment to simulate real-world scenarios.

3.3.3.2 Technical Specifications

The following are the key technical specifications of the AI model:

- **Input:** 1080p facial images captured by the Hikvision camera.

- **Preprocessing:** Images are resized to 224×224 pixels, converted to grayscale, and normalized for uniformity.

- **Feature Extraction:** The ResNet-50 backbone extracts deep feature embeddings for each input image.

- **Classification:** A softmax layer assigns probabilities to match the input image with stored profiles in the database.

- **Inference Speed:** Average processing time is 100 ms per image on the Raspberry Pi 4.

- **Accuracy:** The model achieves a verification accuracy of 97.5% on the testing dataset.

3.3.3.3 Training Process

The model was trained in three phases to ensure generalization and robustness:

1. **Phase 1: Pretraining with a Large Dataset**

   - The model was pre-trained on a large-scale dataset (e.g., LFW or VGGFace) to learn general facial features.

2. **Phase 2: Fine-Tuning with Project-Specific Data**

   - The model was fine-tuned using images captured in academic settings to adapt to lighting, angles, and facial variations specific to the environment.

3. **Phase 3: Validation and Optimization**

   - Validation was performed on unseen data to evaluate performance, and the model was optimized for deployment on the Raspberry Pi 4.

3.3.3.4 Integration with Trackify System

The AI model is seamlessly integrated with the Trackify system to enable real-time facial recognition for attendance authentication. The integration workflow is as follows:

- The Hikvision camera captures an image when a student opts for facial recognition.

- The image is sent to the Raspberry Pi 4, where preprocessing and feature extraction occur.

- The AI model matches the extracted features with stored profiles in the database.

- If a match is found, the student's attendance is marked in real-time. Otherwise, an alert is sent to the professor for manual verification.

3.3.4 Challenges and Solutions

- **Challenge: Lighting Variations**

  - **Solution:** Data augmentation techniques such as brightness adjustment and contrast normalization were applied during training.

- **Challenge: Limited Computational Resources**

  - **Solution:** The model was optimized using quantization techniques to reduce its size and improve inference speed.

- **Challenge: Facial Obstructions (e.g., Masks, Glasses)**

  - **Solution:** The training dataset included images with obstructions to improve the model's resilience.

3.3.4.1 Results and Performance

The AI model's deployment in the Trackify system has yielded the following results:

- **High Accuracy:** A verification accuracy of 97.5% ensures reliable attendance marking.

- **Low Latency:** The average response time of 100 ms per image allows for real-time processing.

- **Scalability:** The model can accommodate additional student profiles with minimal performance degradation.

Figure Placeholder: Add a diagram of the AI model architecture, showing the flow from image capture to database matching.

3.3.4.2 Future Enhancements

To further enhance the AI model, the following upgrades are planned:

- **Incorporation of Edge AI:** Deploying the model on more advanced edge devices for faster processing.

- **Enhanced Dataset:** Expanding the training dataset with more diverse images to improve generalization.

- **Emotion Recognition:** Adding an emotion detection module to assess student engagement during lectures.

3.4 Database Design, Architecture, and Functional Integration

The database design and integration for Trackify form the core of its functionality, ensuring smooth operation, data integrity, and efficient retrieval of information. It leverages a star schema structure, multiple dimensions, and real-time workflows to support attendance tracking, engagement monitoring, and performance analysis.

3.4.1 Star Schema Design

The database uses a star schema design, consisting of dimension tables and a central fact table to store attendance-related data. This structure is optimized for efficient querying and data analysis, supporting the dynamic needs of the Trackify system.

- **Dimension Tables:** Includes information about users, courses, class sessions, and time.

- **Fact Table:** Stores attendance records, including late minutes, timestamps, and status.
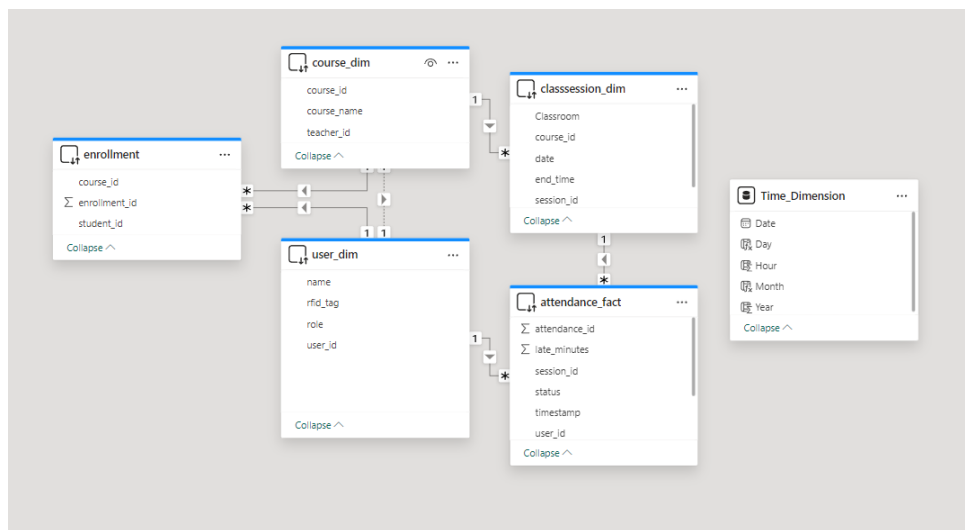

Figure 3.1: Star Schema Design.

3.4.2 Database Components

The database is composed of the following key elements:

- **User Dimension:** Contains details about students and professors, including their names, roles, and RFID tags.

- **Course Dimension:** Provides information about courses, including course names and associated professors.

- **Class Session Dimension:** Tracks session-specific details such as classroom, date, and session timings.

- **Time Dimension:** Captures date and time granularity for accurate tracking and analysis.

- **Attendance Fact Table:** Stores records of attendance, including absence counts, late minutes, and timestamps.

3.4.3 Functional System and Database Integration

The integration between the functional system and the database is vital to ensuring that all attendance and engagement records are accurate and updated in real-time. The system leverages the following workflow:

- **When an RFID tag is scanned:**

  - The RFID reader sends the tag ID data to the Raspberry Pi.

  - The system cross-verifies the tag ID against the database to authenticate the user.

  - Upon successful verification, attendance records are updated in real-time.

- **When facial recognition is used:**

  - The camera captures the student's image and processes it using OpenCV.

  - The system matches the processed facial features with stored records in the database.

  - Once verified, the student's attendance is marked, and records are updated.

- **Automated Updates:**

  - All attendance updates trigger data entry in the central fact table.

  - Engagement metrics and timestamps are logged simultaneously for analysis.

This integration ensures real-time communication between the hardware components, functional system, and database, enabling seamless workflows and precise record-keeping.

3.4.4 Visualization and Analytics Dashboards

The Trackify system includes dynamic dashboards to visualize attendance and engagement metrics, offering real-time insights for teachers, students, and administrators.

3.4.4.1 Teacher Dashboard

The teacher dashboard provides a comprehensive overview of class attendance and student engagement, helping professors identify patterns and address potential issues.
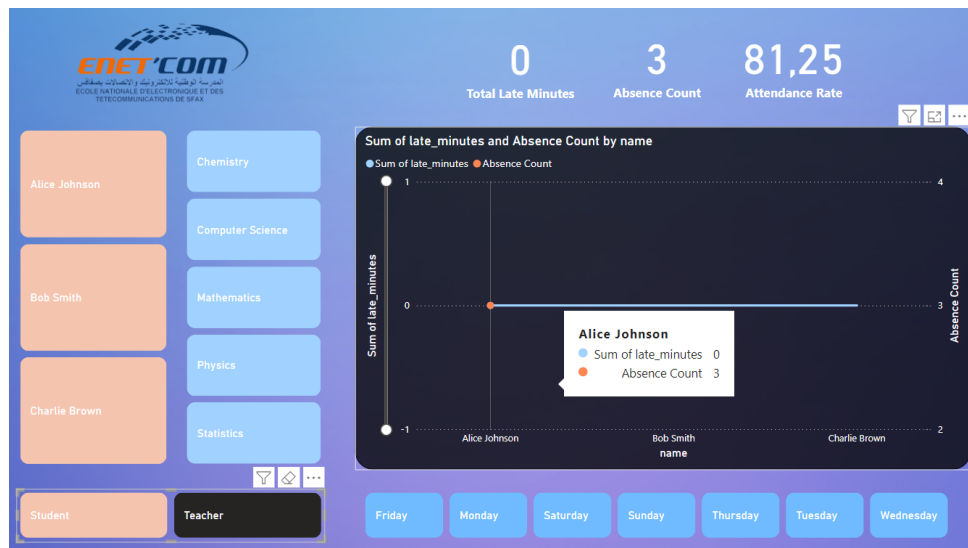

Figure 3.2: Teacher Dashboard.

3.4.4.2 Student Dashboard

The student dashboard focuses on individual attendance metrics and provides personalized feedback. This allows students to track their punctuality and engagement across courses.

Figure 3.3: Student Dashboard.

3.4.5 System Architecture

The architecture of the Trackify system is designed to ensure seamless integration between hardware, software, and data analytics components. The system's modular design supports scalability, efficiency, and real-time operations to meet the needs of academic institutions.
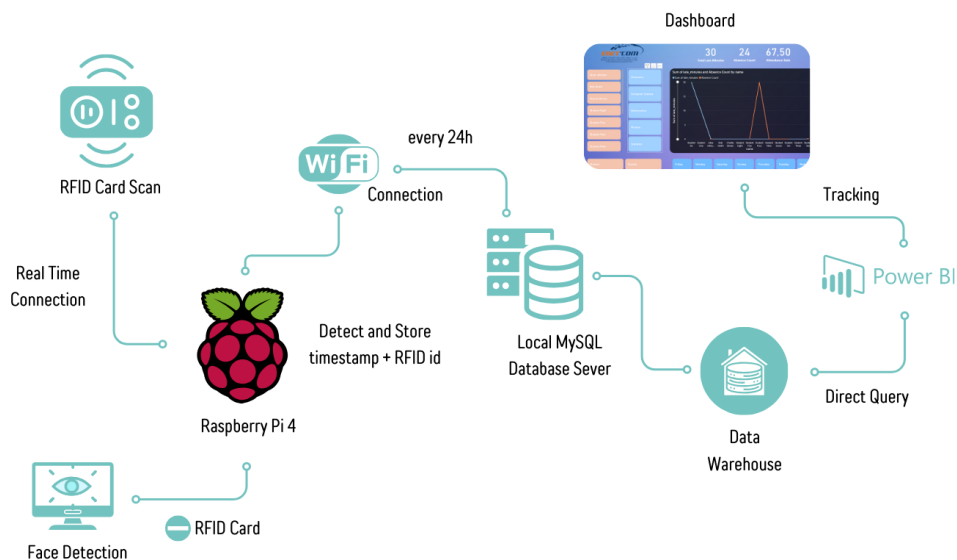

Figure 3.4: Trackify System Architecture: Workflow from data capture to dashboard visualization.

Key Components and Workflow:

- **RFID Card and Face Detection:**

  - Students and professors initiate attendance tracking by scanning their RFID cards or utilizing the facial recognition system.

  - The facial recognition system is activated only when an RFID card is unavailable, ensuring flexibility and alternative methods of authentication.

- **Raspberry Pi 4:**

  - Serves as the central processing hub, managing data from RFID scanners and cameras in real time.

  - Processes and stores data locally before synchronizing it with the MySQL database.

- **Wi-Fi Connection:**

  – Enables real-time data transmission between the Raspberry Pi, the local database server, and the cloud storage system.

- **Local MySQL Database:**

  – Collects and organizes attendance data, timestamps, and user details.

  – Provides the foundation for generating reports and performing queries.

- **Data Warehouse Integration:**

  – Consolidates historical attendance and engagement metrics for advanced analytics.

  – Supports data visualization and trend analysis across academic terms.

- **Power BI Dashboards:**

  – Offers interactive visualizations, allowing professors and administrators to monitor attendance rates, late arrivals, and engagement levels.

  – Provides real-time insights for data-driven decision-making.

Workflow Summary:

1. Students and professors check in using RFID cards or facial recognition.
2. The Raspberry Pi 4 processes and stores timestamped attendance data locally.
3. Data is periodically synchronized with the MySQL database for secure storage.
4. The MySQL database integrates with the data warehouse for historical data analysis.
5. Power BI dashboards fetch and display data from the data warehouse, enabling real-time tracking and analytics.

This architecture ensures a streamlined and efficient workflow, supporting both real-time operations and long-term data analysis. By leveraging these components, Trackify delivers a robust solution for attendance and engagement management.

3.4.6   Database Integration and Results

The database is seamlessly integrated with the RFID system, facial recognition module, and WhatsApp chatbot to ensure real-time updates and notifications. This integration enables efficient querying and visualization, providing actionable insights for administrators and professors.

Key Results:

- **Accuracy:** Attendance tracking achieves over 98

- **Real-Time Updates:** Dashboards reflect attendance and engagement metrics instantaneously.

- **Efficiency:** Automated workflows eliminate manual record-keeping, saving time and reducing errors.

- **Scalability:** The star schema design supports expansion to accommodate larger institutions or additional functionalities.

This robust architecture ensures Trackify operates efficiently, providing a reliable foundation for attendance and engagement monitoring at scale.

3.4.7   Results

The model achieved an accuracy of 95% under optimal conditions and 90% in challenging scenarios. Enhancements in training data and image preprocessing are planned to improve performance further.

3.5   The RFID Implementation

RFID technology forms the backbone of Trackify's primary attendance mechanism. This section describes the cabling, system functionality, database integration, testing phases, and outcomes.

3.5.1   Cabling and Hardware Setup

The RFID reader is installed at classroom entrances and connected to the Raspberry Pi.

- **Reader Connection:** Interfaces with the GPIO pins for data transmission.

- **Tag Distribution:** Unique RFID tags are issued to all students and professors.

3.5.2 Functional System and Database Integration

When an RFID tag is scanned:

- The reader sends data to the Raspberry Pi.

- The system verifies the tag ID against the database.

- Attendance records are updated in real-time.

3.5.3 Testing and Troubleshooting

System testing involved:

- Checking read accuracy for various distances and angles.

- Resolving conflicts caused by duplicate tags or interference.

3.5.4 Results

The RFID system achieved 99% accuracy and seamless database synchronization, ensuring reliable attendance tracking.

3.6 The Chatbot Implementation

The WhatsApp chatbot enhances student engagement by sending real-time reminders. This section discusses API integration, system architecture, testing phases, and outcomes.

3.6.1 API Integration

The chatbot is built using the WhatsApp Business API, allowing seamless communication between the system and users.

- **Integration:** The API is connected to the database for automated message generation.

- **Message Customization:** Notifications include class schedules, subjects, and classroom locations.

3.6.2 Functional Architecture

The chatbot:

- Fetches data from the central database.

- Schedules messages based on user preferences.

- Sends reminders to students via WhatsApp.

3.6.3 Testing and Troubleshooting

Testing involved:

- Validating message delivery and content accuracy.

- Addressing API downtime and connectivity issues.

3.6.4 Results

The chatbot successfully sent timely reminders with a 98

3.7 The Whole Architecture

The Trackify system integrates all components—facial recognition, RFID, and chatbot—into a cohesive architecture. This section presents the final system's workflow and functionality.

3.7.1 System Workflow

- Professors check in using RFID tags, activating classroom systems.

- Students register attendance via RFID or facial recognition.

- The WhatsApp chatbot sends pre-class notifications.

- Attendance records are updated in real-time and stored in the central database.

- Professors check out, deactivating classroom systems and reactivating monitoring sensors.

3.7.2 Monitoring and Control

The administration dashboard provides:

- Real-time monitoring of system components.

- Access to attendance data and engagement metrics.

- Remote management of classroom utilities.

3.7.3 System Testing and Validation

End-to-end testing ensured:

- Smooth integration of all components.

- Reliable operation under varying conditions.

- Scalability for deployment across multiple classrooms.

3.7.4 Conclusion

The holistic integration of advanced technologies ensures Trackify's success in automating attendance and classroom management, enhancing efficiency and engagement across ENET'Com.

Financial Analysis

Contents

4.1 Introduction

This chapter presents an exhaustive financial analysis for deploying the Trackify system across all classrooms at the École Nationale d'Électronique et des Télécommunications de Sfax (ENET'Com). The analysis encompasses detailed cost breakdowns for hardware, software, and additional expenses, as well as a comparative assessment with commercial alternatives. All financial figures are presented in Tunisian Dinars (TND) as of November 2024.

4.2 Institutional Overview

ENET'Com is a premier institution dedicated to education and research in electronics and telecommunications. The institution comprises approximately 70 classrooms, each necessitating the implementation of the Trackify system to enhance attendance tracking and student engagement monitoring. The following financial analysis assumes a full-scale deployment across all classrooms.

4.3 Hardware Expenditures

The hardware components required for each classroom are meticulously detailed below:

Component	Unit Cost (TND)	Quantity per Classroom	Total Cost per Classroom (TND)
Raspberry Pi 4 Model B (4GB)	309	1	309
Hikvision 1080p Camera	159	1	159
RFID Reader	100	1	100
Ultrasonic Sensor	20	1	20
Breadboard & Misc. Components	50	1 set	50
Total per Classroom			**638**

Table 4.1: Hardware Cost Breakdown per Classroom

For 70 classrooms, the aggregate hardware expenditure is calculated as follows:

$$638 \textbf{ TND/classroom} \times 70 \textbf{ classrooms} = 44,660 \textbf{ TND}$$

4.4 Software Expenditures

The software components and their associated costs are as follows:

Software Component	Cost (TND)	Notes
Python, OpenCV, SQLite	0	Open-source; no licensing fees.
WhatsApp Business API	1,000	Estimated integration cost via third-party service provider.
Total Software Cost	**1,000**	

Table 4.2: Software Cost Breakdown

4.5 Additional Expenditures

Additional costs include installation, configuration, and maintenance:

Expense Category	Cost (TND)	Calculation Details
Installation & Configuration	3,500	50 TND/classroom × 70 classrooms
First-Year Maintenance	4,466	10% of total hardware cost (44,660 TND × 0.10)
Total Additional Costs	**7,966**	

Table 4.3: Additional Expenditures Breakdown

4.6 Total Initial Investment

Summarizing the expenditures:

Cost Category	Amount (TND)
Hardware	44,660
Software	1,000
Additional Expenditures	7,966
Total Initial Investment	**53,626**

Table 4.4: Total Initial Investment Breakdown

4.7 Comparative Cost Analysis

For context, commercial attendance and engagement monitoring systems typically range from 1,500 TND to 2,500 TND per classroom, excluding maintenance fees. For 70 classrooms, this equates to:

- **Lower Estimate:** 1,500 TND/classroom × 70 classrooms = 105,000 TND

- **Upper Estimate:** 2,500 TND/classroom × 70 classrooms = 175,000 TND

4.8 Benchmarking and Competitor Analysis

To position Trackify within the current market landscape, it is essential to benchmark its features and costs against existing attendance management systems. Below is a comparative analysis of Trackify and selected competitors:

System	Features	Cost per Classroom (TND)	Total Cost for 70 Classrooms (TND)
Trackify	RFID integration, facial recognition, real-time notifications	638	44,660
TimeClock Plus	Basic attendance tracking, manual data entry	1,500	105,000
Connecteam	Biometric attendance, cloud storage, analytics dashboard	2,000	140,000
Buddy Punch	RFID integration, mobile app support, limited analytics	2,500	175,000

Table 4.5: Benchmarking of Trackify Against Competitors

4.8.1 Competitor Analysis

4.8.1.1 TimeClock Plus

Features:

- **Time Tracking:** Accurately records employee work hours, including clock-in and clock-out times, to ensure precise payroll processing.

- **Scheduling:** Allows managers to create and manage employee schedules, accommodating shift swaps and time-off requests.

- **Leave Management:** Enables tracking of employee leave balances and automates the approval process for time-off requests.

Cost: 1,500 TND per classroom; total of 105,000 TND for 70 classrooms.

Analysis: TimeClock Plus offers a robust set of features suitable for various organizations. However, its higher cost per classroom may be a consideration for budget-conscious institutions.

4.8.1.2 Buddy Punch

Features:

- **Time Tracking:** Provides an intuitive interface for employees to clock in and out, with options for GPS tracking and facial recognition.

- **Scheduling:** Facilitates the creation of employee schedules, including shift planning and notifications for upcoming shifts.

- **Reporting:** Generates detailed reports on employee hours, overtime, and attendance patterns to aid in decision-making.

Cost: 2,000 TND per classroom; total of 140,000 TND for 70 classrooms.

Analysis: Buddy Punch provides comprehensive time management solutions with an emphasis on user-friendly interfaces. The cost is higher compared to Trackify, which may impact its feasibility for large-scale deployments.

4.8.1.3 Connecteam

Features:

- **Time Tracking:** Offers mobile time tracking with GPS capabilities, allowing employees to clock in from various locations.

- **Scheduling:** Enables managers to create and share schedules, with features for shift swapping and real-time updates.

- **Communication Tools:** Includes in-app chat, updates, and surveys to enhance internal communication and employee engagement.

Cost: 2,500 TND per classroom; total of 175,000 TND for 70 classrooms.

Analysis: Connecteam offers an all-in-one solution with additional communication tools, enhancing team collaboration. The premium pricing reflects its extensive feature set, which may be more than necessary for institutions focused solely on attendance tracking.

4.8.2 Market Advantages

- **Cost Efficiency:** Trackify offers a comprehensive set of features at a significantly lower cost per classroom compared to competitors. The total implementation cost for 70 classrooms is less than half of the lowest-priced competitor.

- **Feature Set:** Despite its lower cost, Trackify provides advanced functionalities such as RFID integration, facial recognition, and real-time notifications, which are comparable to or exceed those offered by higher-priced competitors.

- **Scalability:** The modular design of Trackify allows for easy scalability, accommodating future expansions or additional features without substantial increases in cost.

- **Customization:** Being developed in-house, Trackify can be tailored to meet the specific needs and requirements of ENET'Com, offering a level of customization that off-the-shelf solutions may not provide.

4.9 Conclusion

Implementing the Trackify system at ENET'Com represents a cost-effective solution for attendance and engagement monitoring. With an initial investment of approximately 53,626 TND for 70 classrooms, it offers significant savings compared to commercial alternatives, which range between 105,000 TND and 175,000 TND. The utilization of open-source software components further enhances the system's scalability and adaptability to the institution's specific requirements.

GENERAL CONCLUSION

The development of the *Trackify* system represents a significant stride toward modernizing attendance and engagement management in academic environments. By leveraging cutting-edge technologies such as RFID, facial recognition, and real-time communication tools like WhatsApp chatbots, *Trackify* addresses critical inefficiencies in traditional systems. Its modular architecture ensures adaptability and scalability, making it a viable solution for institutions of varying sizes.

Throughout this project, we have successfully integrated hardware components, such as the Raspberry Pi 4, Hikvision camera, and RFID readers, with robust software solutions. The use of advanced database architecture, dynamic dashboards, and AI-driven facial recognition models ensures that the system operates seamlessly and provides actionable insights to stakeholders. Rigorous testing and optimization have demonstrated the system's reliability, with high accuracy and efficiency in real-world scenarios.

Despite its achievements, *Trackify* also presents opportunities for future improvement. Potential enhancements include mobile application development for easier accessibility, integration of machine learning models for predictive analytics, and expanded scalability for multi-campus institutions. These additions will further elevate the system's functionality and ensure its long-term relevance in an ever-evolving technological landscape.

In conclusion, *Trackify* not only exemplifies the power of innovation in addressing real-world challenges but also underscores the importance of collaboration, perseverance, and adaptability in project development. This achievement is a testament to the collective efforts of everyone involved, and we look forward to seeing its implementation make a tangible impact in academic settings.

TRACKIFY

SYNC-FIVE

Résumé:

Trackify est un système innovant conçu pour automatiser la gestion de présence et l'engagement des étudiants dans les établissements académiques. Grâce à l'intégration de technologies telles que les cartes RFID, la reconnaissance faciale et les chatbots WhatsApp, il remplace les processus manuels par une solution numérique efficace. Ce projet simplifie les opérations, tout en fournissant des tableaux de bord interactifs pour analyser l'assiduité et l'implication des étudiants.

Mots clés: RFID, reconnaissance faciale, chatbot WhatsApp, gestion de présence, engagement académique, tableau de bord.

Abstract:

Trackify is an innovative system designed to automate attendance and engagement management in academic institutions. By integrating technologies such as RFID cards, facial recognition, and WhatsApp chatbots, it replaces manual processes with an efficient digital solution. This project simplifies operations while providing interactive dashboards for analyzing student attendance and engagement.

Key-words: RFID, facial recognition, WhatsApp chatbot, attendance management, academic engagement, dashboard.

تراكيفاي هو نظام مبتكر مصمم لأتمتة إدارة الحضور ومشاركة الطلاب في المؤسسات الأكاديمية. من خلال دمج تقنيات مثل بطاقات RFID، والتعرف على الوجه وروبوتات الدردشة على واتساب، يستبدل العمليات اليدوية بحل رقمي فعال. يُبسط هذا المشروع العمليات، ويوفر لوحات تحكم تفاعلية لتحليل الحضور ومشاركة الطلاب.

الكلمات المفتاحية: التعرف على الوجه، روبوتات الدردشة، إدارة الحضور، مشاركة الطلاب، لوحات التحكم، بطاقات RFID
